Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the Buropean Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@igb-sib.ch).
cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           KALLIKREIN 7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunology 78:159-165(1991)

-!- FUNCTION: Contributes to the lung's defense against inhaled microorganisms. Binds strongly maltose residues and to a lesser extent other alpha-glucosyl moieties. It could participate in the extracellular reorganization or turnover of pulmonary surfactant.
-!- SUBSUNIT: Oligomeric complex of 4 set of homotrimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-FEB-1994 (Rel. 28, Created)

-!- MISCELLANEOUS: Pulmonary surfactant consists of 90% lipid and 10% protein. There are 4 surfactant-associated protein: 2 collagenous, carbohydrate-binding glycoproteins (SP-A and SP-D) and 2 small hydrophobic proteins (SP-B and SP-C).
-!- SIMILARITY: Contains 1 collagenous domain.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HSSP; P35247; 1B08.

The carbohydrate specificity of conglutinin and its homology to

Proteins in the hepatic lectin family.";

Blochem. Blochys. Res. Commun. 143:645-651(1987).

Blochem. Blochys. Res. Commun. 143:645-651(1987).

Leoniplement component (CSD1). It is capable of binding nonreducing terminal Nacetylglucosamine, mannose, and fucese residues.

Complement component (CSD1). It is capable of binding nonreducing terminal Nacetylglucosamine, mannose, and fucese residues.

Complement component (CSD1). It is capable of binding nonreducing terminal Nacetylglucosamine, mannose, and fucese residues.

Complement of set of homotrimers.

Collagenous domain.

MISCELLANBOUS: Binds zinc and copper in the extracellular domain.

MISCELLANBOUS: Binds zinc and copper in the extracellular domain.

MISCELLANBOUS: Binds zinc and copper in binding. No Cu(II) reducing activity with copper-binding.

SIMILARITY: Belongs to the APP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Apoptosis; EndocytosIs; Cell adhesion; Coated pits; Neurone; Heparin-binding; Metal-binding; Copper; Zinc; Signal; Transmembrane;

-!- SUBDINIT: Oligomeric complex of 6 set of homotrimers.
-!- SUBCELLULAR LOCATION: THIS PROTEIN IS LOCATED INTRACELLULAR, MOST PREDOMINANTLY IN THE ROUGH ENDOPLASMIC RETICULM AND IN THE GOLGI APPARATUS, AND LITTLE OR NO MBP IS PRESENT IN PLASMA MEMBRANES AND LYSGOMES. THE MBP IS EXCLUSIVELY LOCALIZED IN THE CISTERNAL SPACE OF THE ORGANELLES, PROBABLY AS LOCOSELY BOUND MEMBRANE PROTEIN.
-!- SIMILARITY: Contains 1 collagenous domain.
-!- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- FUNCTION: Binds mannose and N-acetylglucosamine in a calcium-dependent manner. Is capable of host defense against pathogens, by activating the classical complement pathway independently of the

     ##DULINESTRING TO CONTROL S.P., Waldmann H.;
GORMAN S.D., Frewin M.R., Cobbold S.P., Waldmann H.;
"Isolation and expression of cDNA encoding the canine CD4 and CD8
alpha antigens.";
Tissue Antigens 4.;
FUNCTION: Identifies cytotoxic/suppressor T-cells that interact
with MHC class I bearing targets. CD8 is thought to play a role in
the process of T-cell mediated killing. CD8 alpha chains binds to
class I MHC molecules alpha-3 domains.
Inthed by two disulfide bonds. Can albo form homodimers.
SUBCELLULAR LOCATION: Type I membrane protein.
SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        T-CELL SURFACE GLYCOPROTEIN CD8 ALPHA

J. Mol. Biol. 286:817-817(1999).

-!- FUNCTION: Major secreted protease of mast cells with suspected
roles in vasoactive peptide generation, extracellular matrix
degradation, and regulation of gland secretion.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Phe-|-Xaa > Tyr-|-Xaa > Leu-|-Xaa |
-!- STBCELDULAR LOCATION: Mast cells in lung, heart, skin and placenta.
-!- SIMILARITY: Belongs to peptidase family Sl. Granzyme subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDIINE-93265916; PubMed-8495723; Sukenaga Y., Kido H., Neki A., Enomoto M., Ishida K., Takagi K., Katunuma N.; "Purification and molecular cloning of chymase from human tonsils."; PERS Lett. 323:119-122(1993).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 597266
GENERAL INCORMATION:
APPLICANT: O'Brien, Timothy J.
APPLICANT: O'Brien, Timothy J.
APPLICANT: O'Brien, Timothy J.
TITLE OF INVENTION: FALCOSIN:
TITLE OF INVENTION: Pacast and Ovarian Carcinomas
CURRENT APPLICATION NUMBER: US/09/027,337B
CURRENT FILING DATE: 1998-02-20
NUMBER OF SEQ ID NOS: 13
                                                                                                                                                   .

```
The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCB). Proteases are considered to be an integral part of tumour growth and metastisis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                                                                                      Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                                                             Human stratum corneum chymotrypsin enzyme peptide #3 (residues 58-66).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing cancer comprises detecting stratum corneum chymotrypsin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 25; Page 103; 127pp; English.

```
The present invention describes NoVX proteins, where X can be 1 to 55 (e.g. NOVY). Also described: (1) a composition comprising a polypeptide described above and a carribed; (2) a kit comprising, in one or more described above and a carribed above; (3) an isolated mucleic acid containers, the composition described above; (4) an isolated mucleic acid molecule described above; (5) a cell mount of the above polypeptide described above; (6) a cell comprising the nucleic acid molecule described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above copypeptide or nucleic acid molecule in a first mammalian subject; (9) a mample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for apthology associated with the polypeptide; (12) a method for sortening for a modulator or apthology associated with the polypeptide; (13) a method of cor identifying a pathology associated with the above polypeptide. Novy correctivity of the polypeptide described above polypeptide in a method for protective, antipacted in a method for protective, antipacted and antilipaemic activity of the polypeptide above polypeptide in a method for protective, neuroprotective, antipacting of syndrome associated with a human disease. The polypeptide or the mucleic acid molecule may be used to diagnose, treat or prevent metabolic conditions. The present expressence and various plantancement invention. The present expressence and present express
                                                                     New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or
                                                                                                                                                                                                                Claim 1; Page 171; 586pp; English.

```
The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, only more and gene mapping, and in recombinant production of (II). The polynuclectides are also used in dispossites as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is oblypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging to supplement. (II) and its binding partners are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in the protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in the cappendance other types of data and products dependent on DNA and amino acid sequences. ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGOONIO-ABGO
                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 20; SEQ ID NO 53737; 103pp; English.

WPI; 2003-381626/36. N-PSDB; ADA05737 New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 1; Page 171; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 described above and a carrier; (2) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the mucleic acid molecule described above; (5) a vector comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the prospection of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above to lidentifying an agent that binds to the polypeptide described method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to

```
the activity of the polypeptide, (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide. Now, sequences have antidabetic, anotoroid; antibacterial, virucide, immunomodulator, cytostatic, nootropic, antibacterial, virucide, and antilippemic attivities, and can be used in gene therapy. The collapseptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid molecules such as Alzheimer's disease or Parkinson's disease, immune disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various probes, in chromosome mapping, tissue typing, preventive medicine and parmacogenomics. The present sequence represents a human NoVX from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention.

Claim 1; Page 170; 585pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit composition or more containers, the composition described above; (3) an isolated nucleic acid containers, the composition described above; (5) a notainers, the composition of the invention; (4) a vector comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically by instance or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a delace or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic described above; (10) a method for identifying a potential therapeutic agent for compression or a disease associated with altered levels of the polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological intracactions of the polypeptide; (11) a method of creening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for medial or or preventing a pathology associated with the above polypeptide; (12) and method for medial and (14) a method for protectic, and that can be associated with the above polypeptide; (12) and antilipaemic activities, and can be used a bove polypeptide; and antilipaemic activities, and can be used a bove polypeptide in a method for protectic, and antilipaemic activities, and can be used a prevent metabolic controller and antilipaemic acidities on obesity, infections, candersay, the nucleic acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, and preventive metabolic controller in a protections, cachexia, and antilipaemic present invention.

```

The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in overlan tumours. TADG-15 protein or its fragments of 9.20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15 ; 0 100.0%; Score 47; DB 4; Length 225; 100.0%; Pred. No. 2.2; tive 0; Mismatches 0; Indels Query Match

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

# Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising in one or more
containers, the composition described above; (3) an isolated nucleic acid
containers, the composition described above; (3) an isolated nucleic acid
comprising the nucleic acid molecule described above; (5) a call
comprising the above vector; (6) an antibody that immunospecifically
comprising the above vector (6) an antibody that immunospecifically
comprising the above polypeptide or nucleic acid molecule in
sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a
disease associated with altered levels of expression of the above;
compression of the above polypeptide or nucleic acid molecule in a
disease associated with altered levels of expression of the above;
compression of the above polypeptide or nucleic agent for a
paver; (10) a method for identifying a potential therapeutic agent for
aberrant physpiological interactions of the polypeptide; (11) a method of
compression of activity or of latency or predisposition to
a pathology associated with the polypeptide; (12) a method for in a
correctivity of the polypeptide described above; (13) methods of traating
the activity of the polypeptide described above; (13) method of
compression of a calivities, and can be used in gene therapy. The
compression of the polypeptide and can be used in gene therapy. The
polypeptide is useful in manufacturing a medicament for treating a

The present invention describes NoVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit composition or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cellolic comprising the nucleic acid molecule described above; (5) a cellolic presence or amount of the above polypeptide cor nucleic acid molecule in a disease associated with altered levels of expression of the above and sease associated with altered levels of expression of the above a disease associated with altered levels of expression of the above and polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for abore; (10) a method for identifying a potential therapeutic agent for abore; (10) a method for identifying a pathology that is related to an aberrant expression or aberrant physological interactions of the polypeptide; (11) a method of series and adulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulation or preventing a pathology associated with the above polypeptide. Novy sequences have anitalabetic, anorectic, antipatecrally, virucide, immunomodulator, cytostatic, noorectic, antipatecrally, virucide, and antilipaemic activities, and can be used in gene therapy The coll man be used in gene therapy. The animulation associated with a human disease. The polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, careary, cancer, disorders such as diabetes or obesity, infections, careary, and pathology according a pathology per
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                    New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenemics.

Claim 1, Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (3) a call ocomprising the above vector; (6) an antihody that immunospecifically binds to the polypeptide described above; (7) methods for determining the parsence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the parsence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a

method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a mediulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide. Now mammal, and (14) a method for producing the above polypeptide. Now sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The colypeptide is useful in manufacturing a medicament for treating a manifacturing a medicament for treating a cydymorphide is useful in manufacturing a medicament for treating a cid molecule may be used to disapte or the polypeptide or the nucleic acid molecule may be used to disabete or observe, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders such as Alzheimer's disease or Parkinson's probes, in chromosome mapping, tissue typing, preventual a muman NoVX from the pharmacogenomics. The present sequence represents a human NoVX from the present invention.

```
Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. B. coli) or eukaryotic (partic. AV-120 host cells. It is used to devalop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease
and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratotic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid pssor. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated human amyloid precursor protein protease - used to develop prods. for the treatment or diagnosis of associated conditions, esp.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence coding for a tleated within its genome, a heterologous nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous soce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve to riss study of disease with the aim of improving treatment, to relieve cornemalized a pathogenic condition, for development or resting of a cosmetic or a pharmaceutical formulation, and for the development of a cosmetic or a pharmaceutical formulation, and for the development of a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis. The mammal of the invention is also useful the engagent of the funan stratum corneum chymotryptic enzyme, SCCE transgenic mammals described in the invention

Transgenic mammals described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence conding for a tratum corneum chymotryptic enzyme (SCCE) or its variant, oding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, or tratum corneum chymotryptic enzyme (SCCE) or its variant, or tratum corneum chymotryptic enzyme (SCCE) or its variant, or tratum corneum chymotryptic enzyme (SCCE) or its variant, or tratument, in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or teatment of a commetic or a pharmaceutical formulation, and for the development of a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an amedal for further studies of ich mechanisms and the testing of spidermal hyperkeratosis. The mammal of the invention is also useful sea a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine procease synonymous with human kallikzein 7 (KLK7) and is used in the development of the invention of the corner of the invention of t Transgenic mammal or its embryo useful as model for human disease, has neterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin. SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serine protease; transgenic mammal; skin; skin disease; skin cancer; hyperkeratosis; acanthosis; epidermal inflammation; dermal inflammation; pruritus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory

Claim 6; Fig 2N; 313pp; English.

The present invention relates to the isolation of novel human proteases, and the mucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal-associated diseases, metabolic coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, pain, sexual dysfunction, mood disorders, attention disorders, pain, sexual dysfunction, mood disorders, attention disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzhahmer's disease, Parkinson's cisease) and dyskinssias. The nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. human proteases of the invention

SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
